

DENTAL HEALTH AND HOME CARE FOR YOUR PET

Did You Know...

- ❑ Periodontal Disease (gum disease) is one of the most common medical conditions seen by veterinarians.
- ❑ Over 85% of dogs and cats, older than four years, have periodontal concerns.
- ❑ One milligram of plaque contains over one-trillion bacteria that can cause disease.
- ❑ By keeping up with your pets dental care, you can extend their life expectancy by 3-5 years.

What is Gum Disease?

- Gum disease, or Periodontal Disease, is the inflammation of some or all of the tooth's support structures (including the gums and bone). Gum disease is caused by bacteria.

Stage 1

Stage 2

Stage 3

Stage 4

Bad Breath 101

□ What is Halitosis?

Halitosis is another word for bad breath.

□ What causes Halitosis?

The most common cause of Halitosis is plaque, (or bacterial buildup) on the teeth.

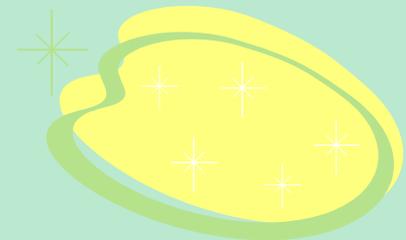

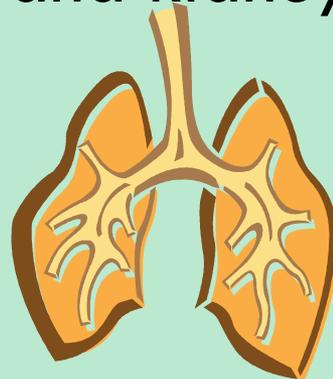

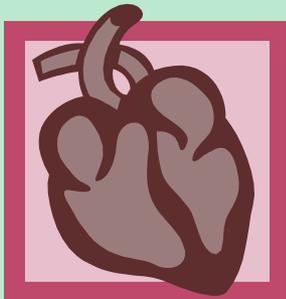

**Severe Periodontal Disease
causing Halitosis**

Effects of Dental Disease

- ❑ The discomfort in your pet's mouth may lead to the inability to chew food or reluctance to eat.
- ❑ Behavioral problems may occur (biting, hiding, marking, irritability, etc).
- ❑ Bacteria from the mouth can travel through the bloodstream affecting vital organs such as the heart, lungs, liver, and kidneys.

Myths About Dental Care

- ❑ **Dental cleanings are purely cosmetic.**
 - ❑ They do make your pet's pearly whites, white again, but they also remove harmful bacteria that causes gum disease.
- ❑ **Dogs and cats do not feel pain the way people do.**
 - ❑ Just as you get a tooth ache or sore gums, pets can experience these pains too (especially if they do not receive regular dental care).
- ❑ **A dog or cat's mouth is cleaner than a human's.**
 - ❑ Most pets do not receive a daily brushing, so bacteria is left building up in their mouths. (Ever wonder where the bad breath comes from?)
- ❑ **Anesthesia-free dental cleanings are as effective as anesthetic cleanings.**
 - ❑ See page 8 for facts.

How to Protect Your Pet

- Bring your pet in for a dental exam where your veterinarian will assess your pet's mouth.
- Your veterinarian will be able to tell you if a professional cleaning is in order.
- If a cleaning is not needed then home care will be discussed.

What Type of Cleaning is Best for My Pet?

With Anesthesia

- All surfaces of the teeth are cleaned
- Can clean beneath and between the gums
- Provides thorough charting of all the teeth
- Able to take full mouth radiographs
- Can provide all treatments at once i.e. if there are extractions
- Safer for the technician, as the animal is unable to bite
- Can adequately polish teeth to prevent cavities and other problems

Without Anesthesia

- Only cleans the outside of the teeth and the crown
- Unable to adequately chart all teeth
- Unable to take dental radiographs.
- May cost more money if the animal needs further treatment under anesthesia
- Not as safe for the vet (they can be bitten by the animal)
- Can damage the tooth or gums if the animal moves during treatment

Dental Care At Home

- It is important to talk to your vet about routine dental care that you can provide for your pet at home.
- Ask your vet about the following products and if they're right for your pet!
 - Oxyfresh
 - Maxiguard Gel
 - Brushing Teeth
 - C.E.T. Chews
 - Oravet Sealant
 - Tartar Shield Chews

Additional Information

- Please contact your veterinarian for more information.
